Additions and Corrections

The structure of anchorin CII, a collagen binding protein isolated from chondrocyte membrane.

M. Pilar Fernandez, Ornella Selmin, George R. Martin, Yoshihiko Yamada, Michael Pfaffé, Rainer Deutzmann, Jurgen Mollenhauer, and Klaus von der Mark

A part of the nucleotide sequence of chicken anchorin CII published by Fernandez et al. (1988) was incorrect. Owing to a frameshift caused by missing a cytidine in position 374 and additional errors, the deduced amino acid sequence between residues 125 and 170 shown in Fig. 4 is wrong. For correction, new cDNA clones were isolated from a AgT II library prepared from chick bone mRNA with the A1 clone and sequenced. The corrected part is in the boxed area (nucleotides 373-504, amino acid residues 119-162) and now matches with three tryptic peptides (nos. 9, 10, and 11, Table I in Fernandez et al., 1988) that could not be identified in the original anchorin sequence. In its corrected version, the amino acid sequence shows 80% homology to human endonexin (Kaplan et al., 1988) or PP4 (Grundmann et al., 1988; see also Pfaffé et al., 1988).
