Supplementary Figure S1. BNP and Western blot analysis of brain lysates from human controls (C1 and C8) and HD patients with adult onset HD (A11 and A3) and juvenile onset HD (J5). 10 µg of protein were loaded per lane. Antibody Ab1 was used to detect htt. Native full length wt and mutant htt migrate to the level of the 669 kDa marker (arrow). Note that in two of the HD cases (A11 and A3) a htt fragment is detected (open arrowhead). Molecular mass markers are indicated on the left.
